

**SmileLite**  
*is a professional  
solution for your whiter,  
lighter smile.*

**What is  
tooth whitening?**

Tooth whitening is a procedure that lightens discolorations of enamel and dentin. The SmileLite Professional Whitening System uses a safe, effective formula that is applied with a whitening tray, personalized by your dental professional. The tray is worn over your teeth.

**Who will benefit from tooth whitening?**

Just about everyone! You should know, however, that there are some people who may not benefit from treatment.

**What causes  
tooth discoloration?**

There are a number of causes including smoking cigarettes or cigars, drinking certain beverages (coffee, soda, tea, wine), inadequate oral homecare, excessive fluoridation, tetracycline (antibiotic), tooth trauma, nerve degeneration, and the normal aging process. Stains on the teeth can either be on the surface or within the tooth structure.

**Am I a good candidate for whitening?**

Only your dental professional can tell for sure. In general, people with healthy teeth who have brown, orange, or yellow stains are ideal candidates.

**Is whitening safe?**

Trust your dentist. The SmileLite Professional Whitening System is so safe that your dentist has selected it over all the other products available.

**Are there side effects?**

Gum irritation and tooth sensitivity are possible, but rare when SmileLite is used as instructed. These symptoms disappear within days of treatment discontinuation. Patients experiencing tooth sensitivity should use the prescription fluoride enclosed in the SmileLite kit. If the problem persists, contact your dentist.

**How soon will I see results?**

Most people see improvement within a few days. For some people it may take as long as 2 to 3 weeks.

### ***Should I have my teeth whitened?***

It is a personal choice. Millions have said yes and received the benefit of a more confident, bright smile. If you still have questions about whitening, your dentist will gladly answer them for you.

### ***How long do the results last?***

After using SmileLite, your teeth will always be lighter than they were. Some patients may need periodic re-whitening, once or twice every 2 to 4 years. Your ability to maintain your teeth at their whitest will be influenced by the effectiveness of your oral homecare. Plaque and stain buildup will cause your teeth to darken again over time. You may wish to ask your dental professional if you would benefit from using the Rota-dent One Step™, which has superior stain control capabilities.

### ***What is the tooth whitening process?***

#### ***It is a simple procedure:***

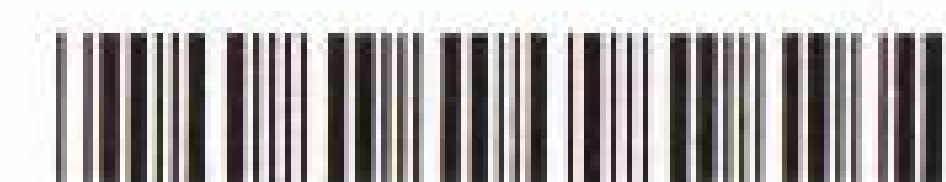

- 1.** Impressions of your upper and lower teeth are made. From these impressions, your dentist makes custom fitting tooth whitening appliances.
- 2.** You are fitted with the appliances, which are clear and very hard to detect at a distance. You will be given the SmileLite Professional Whitening System and personalized instructions about how to use it.
- 3.** To keep your teeth free from tartar and plaque, you and your dental professional will plan the proper homecare regimen in order to keep your smile looking great for a lifetime.
